Date: 14 March 2020

Time: 11.30 am

Venue: Department of Physics, SNACS College, Kiran Nagar, Amravati

- Briefed about Stephen Hawking and his highest will power to overcome his motor neuron disease & Effect of time on the objects
- Scientific approach always give birth to the Scientists.
- Atom its scope and exposure, concept of Hydrogen Bomb, Nuclear Bomb.
- Change of place of electron always related with change of energy.
- Concept of neutron stars-this star always tries to continue its existence, any way
- All stars give light, hence visible.
- Some-way it happens that there is a star where we never receive light.
- After neutron stars, new star exists at some escape velocity.
- On the earth it is 11 km in one second.
- Gravity of earth never block light, but for some objects it happens
- Concept of Black-hole: In high density stars, highly attraction of light in all possible direction happens. Since light is also attracted towards these stars, hence called Black-Hole, it was studied by Professor Stephen Hawking.
- Space what we consider is not plane, it is curved, explained with experiment
- Black-holes try to minimize the distance between two ends.
- Whole Universe is revolving around the time.
- There may be the possibility of encroaching from one Universe to the other Universe.

- He discussed his experiments. As Sun, Earth and Moon has different sphere of influence of gravity, for a single object it is spherical, but if another object comes nearer to it, its influence may not be spherical.
- Due to tides, gravity of Moon affects on the sea water, it means it affects everything, every molecule, etc. Earth and moon revolve around a single point and not around either itself.
- Bary-center point, earthquakes depend only on position of Moon only.
- Golden ratio (God or Divine ratio) of the body is proportionate to 1 to 1.618, which is Universal.
- He notified that Sir C V Raman has developed radiations which are absorbed by the objects.
- According to Sir C V Raman, reflected light is footprint or finger print of that object.

BIOGAS

3rd Prize

Biogas is the mixture of gases produced by the breakdown of organic matter in the absence of oxygen. Primarily consisting of methane and carbon dioxide.

Applications

methane has use in machinery.

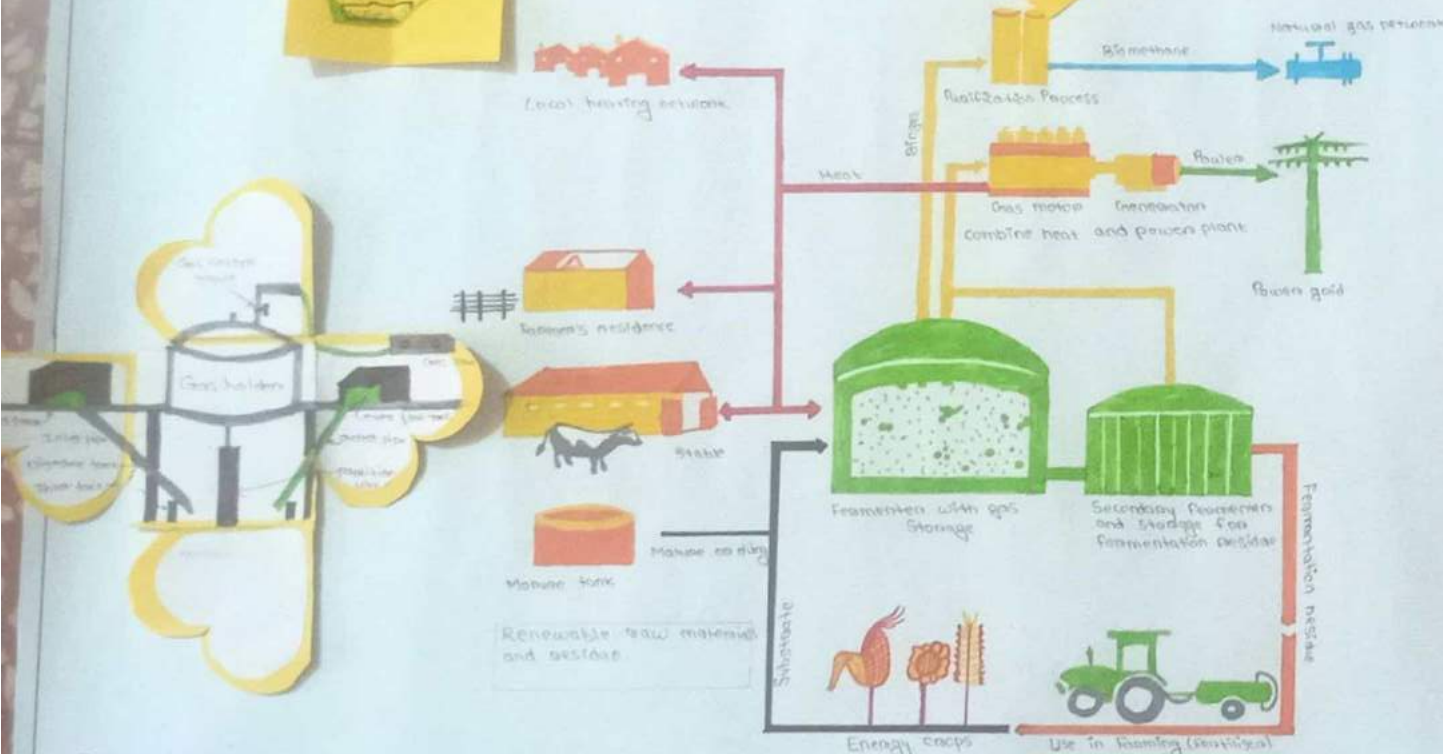

Fig:- Working

Benefits

High levels of methane are produced when manure is stored under anaerobic conditions. During storage and when manure has been applied to the land nitrous oxide is also produced as a byproduct of the denitrification process. Nitrous oxide (N_2O) is 320 times more aggressive as a greenhouse gas than carbon dioxide and methane 25 times more than carbon dioxide. By converting cow manure into methane biogas via anaerobic digestion, the millions of cattle in the United States would be able to produce 100 billion kilowatt hours of electricity.

NATURAL
In soil, methane is produced in anaerobic environments by methanogens, but is mostly consumed in aerobic zones by methanotrophs.

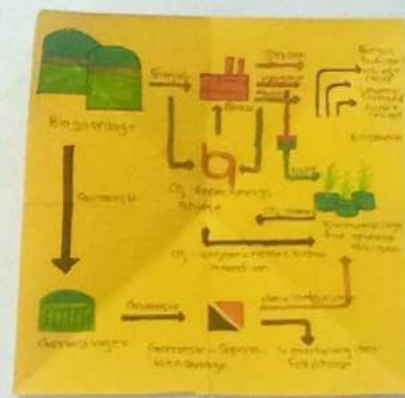

Biogas

A biogas plant is the same as a composting plant, but the waste is broken down in a digester. It can be produced using anaerobic digestion.

Plant

INDUSTRIAL
As landfill gas, which is produced by the breakdown of biodegradable waste inside a landfill due to chemical reactions and microbes.

As digested gas, produced inside an anaerobic digester.

** TIDAL ENERGY **

4th Prize

1. The turbine is mounted on a foundation structure and set on the seabed. No drilling is necessary as it will secure it in place.
2. Tidal current cause the blades to rotate, powering a generator that produces electricity. The output varies with the tides and is predictable.
3. Underwater cables carry the electricity to an onshore substation.
4. The substation is connected to the grid which distributes the electricity.
